Atty Dkt: 1035-128 Art Unit: 2775

1. {ONCE AMENDED} A liquid crystal display device comprising:

a pair of substrates sandwiching liquid crystals therebetween;

a plurality of scanning lines to which scanning signals are successively applied;

a plurality of signal lines to which data signals are successively applied, said signal lines intersecting said scanning lines at right angles;

a switching element which is arranged in a vicinity of each of intersections of said scanning lines and said signal lines, and electrically connected to both of said scanning and signal lines;

a pixel electrode connected to each of said switching elements; said scanning lines, signal lines, switching elements and pixel electrodes being formed on one of said substrates,

a common electrode formed on the other of said substrates so that said common electrode faces said pixel electrode with said liquid crystals therebetween;

a common line for supplying a common signal to said common electrode;

a pixel capacitance, one of electrodes of said pixel capacitance formed by said pixel electrode being connected to said common line; and

a dummy scanning line, formed outside of one of said scanning lines located at an outermost position on either a scanning start side or a scanning end side of scanning signal, for producing a parasitic capacitance between said dummy scanning line and the pixel electrode connected to the scanning line located at the outermost position.

02

11. {ONCE AMENDED} A method of driving a liquid crystal display device including a plurality of scanning line to which scanning signals are successively applied, a plurality of signal lines to which data signals are successively applied, a switching element which is arranged in a vicinity of each of intersections of the scanning lines and the signal lines

TANAKA et al Serial No. 08/835,207 Atty Dkt: 1035-128 Art Unit: 2775

and connected to both of the scanning and signal lines, a pixel electrode connected to each of the switching element, a pixel capacitance formed by the pixel electrode, a common electrode which is arranged to face the pixel electrode, liquid crystals placed between the pixel electrode and the common electrode, and a dummy scanning line formed outside of one of the scanning lines located at an outermost position on either a scanning start side or a scanning end side of scanning signal to produce a parasitic capacitance between the dummy scanning line and the pixel electrode connected to the scanning line located at the outermost position, said method comprising the steps of:

supplying the scanning signal and the data signal to the switching element and supplying a common signal to one of electrodes of the pixel capacitance so as to change an electric potential between the pixel electrode and the common electrode and vary a transmittance of the liquid crystals; and

inputting a signal to the dummy scanning line.

REMARKS

Reexamination of the captioned application is respectfully requested.

A. SUMMARY OF THIS AMENDMENT

By the current amendment, Applicants basically:

- 1. Editorially amend the specification.
- 2. Amend claims 1 and 11.
- 3. Respectfully traverse all prior art rejections.
- 4. Advise the Examiner of the simultaneous filing of Proposed Drawing Changes.
